Problem: Given a set of tables extracted from PDFs {*T*}, (1) classify the concepts into three categories $f: \mathcal{P} \to \mathcal{L}$ (2) unify the cells into (method, dataset, metric, score)-tuples.

Ensemble Learning

Concept-to-Label $f: \mathcal{P} \to \mathcal{L}$

Rule-based classifiers

Three <u>A</u>ssumptions

Learning-based classifiers

- Semantic concept <u>E</u>mbeddings
- Structural concept <u>E</u>mbeddings

Assumption 1

Row/column header indication. If the upper-leftmost cell of the table has a specific word (e.g., "Methods", "Algorithm"), the names on the corresponding columns/rows are more likely to have the label as the word indicates.

T se	Table 4: Performance on the <u>Twitter</u> testing data set by different approaches. d								
W ^{(F}) Algorithm	Precision	Recall	F1 P() Accuracy				
	Textual	0.746	0.693	0.727	0.722

	Late Fusion	0.634	0.610	0.622	0.604				
[CCR	0.831	0.805	0.818	0.809				

$$\min_{\phi,\psi} J_1(\phi,\psi) = \sum_{T=[\mathcal{R},C,\dots]} \sum_{(w,P)\in\mathcal{R}\cup C} \sum_{l\in\mathcal{L}} \left(\sum_{p\in P} \phi(p\in P^{(l)}) - |P| \cdot \psi(w\in W^{(l)}) \right)^2, \quad (6)$$

label prediction ϕ word indication ψ

. 2

Assumption 2

Row/column type consistency. Concepts on the same column/row are likely to have the same type of label. For example, if we know "Precision" is a "metric", then "Recall" is likely to be a "metric".

Table 4: Performance on the <u>Twitter</u> testing of set by different approaches. d						
W ^{(F}) Algorithm	Precision	Recall	F1 P (O) Accuracy	
	Textual	0.746	0.693	0.727	0.722	
	Visual	0.584	0.521	∩ ^ᢏ 73	0.553	

	CCR	0.831	0.805	0.818	0.809	
	Late Fusion	0.634	0.610	0.622	0.604	
P(M	Early Fusion	0.730	0.' B(·,	', ') <u>37</u>	0.717	
_ / -	* INTEREDI	0.001		10	0.000	

$$\max_{\phi} J_2(\phi) = \sum_{T = [\mathcal{R}, C, \dots]} \sum_{P \in \mathcal{R} \cup C} \sum_{p \in P} \phi(p \in P^{(l^*(P))}), \qquad (8)$$

majority of the concepts

Assumption 3

> Cell context completeness. A table often covers all the three types of labels on its columns, rows, and caption, in order to provide complete contexts to explain the values in the cells. For example, if the caption has a dataset name and row names are methods, then the column names are likely to be metric.

 Table 4: Performance on the Twitter testing data

set by different approaches. O								
w ^{(F}	Algorithm	Precision	Recall	F1 P (C) Accuracy			
	Textual	0.746	0.693	0.727	0.722			
	Visual	0.584	0.561	0 573	0.553			
P ^{(F}	Early Fusion	0.730	<u>0.</u> ′ В{∙ ,	`, `) <u>37</u>	0.717			
	Late Fusion	0.634	0.610	0.622	0.604			
	CCR	0.831	0.805	0.818	0.809			

 $\max_{\phi} J_3(\phi) = \sum_{T = [\dots, \mathcal{B}(B_1, B_2, B_3)]} |\cup_{k \in \{1, 2, 3\}} l_k^*|.$ (10)

Learning-based Classifier

Semantic concept embeddings (BERT^[1])

[Paper text] On the other hand, the proposed <u>CCR</u> model can improve the <u>performance of both precision and recall</u> than the two single models. Meanwhile, <u>CCR</u> performs best <u>among all the</u> <u>methods</u> in terms of both <u>F1 and accuracy score</u>.

Structural concept embeddings (HEBE^[2])

Table 1: Our system found inconsistent precision scores reported by two papers [42] (left numbers) and [36] (right numbers) in ACM SIGKDD 2017 Research Track for multilabel classification. Precision differences of bigger than 3% are underlined, which has been able to be claimed as significant improvement on the well-accepted benchmarks.

 - Problem Definition
 - Proposed Approach
 - Experiments
- Summary

ė

. Ó I

•

Summary

> A novel system that extracts experimental evidence from data science literature in PDF format.

- An effort-light method that leverages both rule-based and learning-based methods to unify the tables of experimental results database.
- Capabilities for exploration and analysis over the structured knowledge to facilitate research and practice.
